NMK20303 - Database Management Systems

### Basic SQL

Lecture 6 [Chapter 6]

Mohamed Elshaikh

#### Chapter 6 Outline

- SQL Data Definition and Data Types
- Specifying Constraints in SQL
- Basic Retrieval Queries in SQL
- INSERT, DELETE, and UPDATE Statements in SQL
- Additional Features of SQL

#### Basic Retrieval Queries in SQL

- SELECT statement
  - One basic statement for retrieving information from a database
- SQL allows a table to have two or more tuples that are identical in all their attribute values
  - Unlike relational model (relational model is strictly set-theory based)
  - Multiset or bag behavior
  - Tuple-id may be used as a key

# The SELECT-FROM-WHERE Structure of Basic SQL Queries

• Basic form of the SELECT statement:

SELECT	<attribute list=""></attribute>
FROM	
WHERE	<condition>;</condition>

where

- <attribute list> is a list of attribute names whose values are to be retrieved by the query.
- is a list of the relation names required to process the query.
- <condition> is a conditional (Boolean) expression that identifies the tuples to be retrieved by the query.

### The SELECT-FROM-WHERE Structure of Basic SQL Queries (cont'd.)

• Logical comparison operators

• =, <, <=, >, >=, and <>

- Projection attributes
  - Attributes whose values are to be retrieved
- Selection condition
  - Boolean condition that must be true for any retrieved tuple. Selection conditions include join conditions (see Ch.8) when multiple relations are involved.

#### **Basic Retrieval Queries**

<u>Bdate</u>	<u>Address</u>
1965-01-09	731 Fondren, Houston, TX

1	<u>Fname</u>	Lname	Address
	John	Smith	731 Fondren, Houston, TX
	Franklin	Wong	638 Voss, Houston, TX
1	Ramesh	Narayan	975 Fire Oak, Humble, TX
	Joyce	English	5631 Rice, Houston, TX

**Query 0.** Retrieve the birth date and address of the employee(s) whose name is 'John B. Smith'.

Q0:	SELECT	Bdate, Address
	FROM	EMPLOYEE
	WHERE	Fname='John' AND Minit='B' AND Lname='Smith';

**Query 1.** Retrieve the name and address of all employees who work for the 'Research' department.

Q1:	SELECT	Fname, Lname, Address
	FROM	EMPLOYEE, DEPARTMENT
	WHERE	Dname='Research' AND Dnumber=Dno;

#### Basic Retrieval Queries (Contd.)

(c)	Pnumber	Dnum	Lname	Address	Bdate
	10	4	Wallace	291Berry, Bellaire, TX	1941-06-20
	30	4	Wallace	291Berry, Bellaire, TX	1941-06-20

**Query 2.** For every project located in 'Stafford', list the project number, the controlling department number, and the department manager's last name, address, and birth date.

Q2:	SELECT	Pnumber, Dnum, Lname, Address, Bdate
	FROM	PROJECT, DEPARTMENT, EMPLOYEE
	WHERE	Dnum=Dnumber AND Mgr_ssn=Ssn AND
		Plocation='Stafford';

#### Ambiguous Attribute Names

- Same name can be used for two (or more) attributes in different relations
  - As long as the attributes are in different relations
  - Must **qualify** the attribute name with the relation name to prevent ambiguity

Q1A:	SELECT	Fname, EMPLOYEE.Name, Address
	FROM	EMPLOYEE, DEPARTMENT
	WHERE	DEPARTMENT.Name='Research' AND
		DEPARTMENT.Dnumber=EMPLOYEE.Dnumber;

#### Aliasing, and Renaming

#### • Aliases or tuple variables

 Declare alternative relation names E and S to refer to the EMPLOYEE relation twice in a query:

**Query 8.** For each employee, retrieve the employee's first and last name and the first and last name of his or her immediate supervisor.

SELECT E.Fname, E.Lname, S.Fname, S.Lname

**FROM** EMPLOYEE **AS** E, EMPLOYEE **AS** S

WHERE E.Super\_ssn=S.Ssn;

• Recommended practice to abbreviate names and to prefix same or similar attribute from multiple tables.

# Aliasing, Renaming and Tuple Variables (contd.)

- The attribute names can also be renamed EMPLOYEE AS E(Fn, Mi, Ln, Ssn, Bd, Addr, Sex, Sal, Sssn, Dno)
- Note that the relation EMPLOYEE now has a variable name E which corresponds to a tuple variable
- The "AS" may be dropped in most SQL implementations

#### Unspecified WHERE Clause and Use of the Asterisk

- Missing WHERE clause
  - Indicates no condition on tuple selection
- Effect is a CROSS PRODUCT
  - Result is all possible tuple combinations (or the Algebra operation of Cartesian Product
     – see Ch.8) result

**Queries 9 and 10.** Select all EMPLOYEE Ssns (Q9) and all combinations of EMPLOYEE Ssn and DEPARTMENT Dname (Q10) in the database.

 Q9:
 SELECT
 Ssn

 FROM
 EMPLOYEE;

 Q10:
 SELECT
 Ssn, Dname

 FROM
 EMPLOYEE, DEPARTMENT;

## Unspecified WHERE Clause and Use of the Asterisk (cont'd.)

- Specify an asterisk (\*)
  - Retrieve all the attribute values of the selected tuples
  - The \* can be prefixed by the relation name; e.g., EMPLOYEE \*

Q1C:	SELECT	*
	FROM	EMPLOYEE
	WHERE	Dno=5;
Q1D:	SELECT	*
	FROM	EMPLOYEE, DEPARTMENT
	WHERE	Dname='Research' AND Dno=Dnumber;
Q10A:	SELECT	*
	FROM	EMPLOYEE, DEPARTMENT;

#### Tables as Sets in SQL

- SQL does not automatically eliminate duplicate tuples in query results
- For aggregate operations (See sec 7.1.7) duplicates must be accounted for
- Use the keyword **DISTINCT** in the SELECT clause
  - Only distinct tuples should remain in the result

Query 11. Retrieve the salary of every employee (Q11) and all distinct salary values (Q11A).

Q11:	SELECT FROM	ALL Salary EMPLOYEE;
Q11A:	SELECT FROM	DISTINCT Salary EMPLOYEE;

#### Tables as Sets in SQL (cont'd.)

- Set operations
  - UNION, EXCEPT (difference), INTERSECT
  - Corresponding multiset operations: UNION ALL, EXCEPT ALL, INTERSECT ALL)
  - Type compatibility is needed for these operations to be valid

**Query 4.** Make a list of all project numbers for projects that involve an employee whose last name is 'Smith', either as a worker or as a manager of the department that controls the project.

Q4A:	(SELECT	DISTINCT Pnumber
	FROM	PROJECT, DEPARTMENT, EMPLOYEE
	WHERE	Dnum=Dnumber AND Mgr_ssn=Ssn
		AND Lname='Smith' )
	UNION	
	( SELECT	DISTINCT Pnumber
	FROM	PROJECT, WORKS_ON, EMPLOYEE
	WHERE	Pnumber=Pno AND Essn=Ssn
		AND Lname='Smith' );

### Substring Pattern Matching and Arithmetic

#### Operators

- LIKE comparison operator
  - Used for string **pattern matching**
  - % replaces an arbitrary number of zero or more characters
  - underscore (\_) replaces a single character
  - Examples: WHERE Address LIKE '%Houston,TX%';
  - WHERE Ssn LIKE '\_\_1\_ 8901';
- **BETWEEN** comparison operator

E.g., in Q14 :

WHERE(Salary BETWEEN 30000 AND 40000)

**AND** Dno = 5;

#### Arithmetic Operations

- Standard arithmetic operators:
  - Addition (+), subtraction (-), multiplication (\*), and division (/) may be included as a part of SELECT
- **Query 13.** Show the resulting salaries if every employee working on the 'ProductX' project is given a 10 percent raise.

SELECT E.Fname, E.Lname, 1.1 \* E.Salary AS Increased\_sal
FROM EMPLOYEE AS E, WORKS\_ON AS W, PROJECT AS P
WHERE E.Ssn=W.Essn AND W.Pno=P.Pnumber AND P.Pname='ProductX';

#### Ordering of Query Results

- Use ORDER BY clause
  - Keyword **DESC** to see result in a descending order of values
  - Keyword **ASC** to specify ascending order explicitly
  - Typically placed at the end of the query

ORDER BY D.Dname DESC, E.Lname ASC, E.Fname ASC

#### Basic SQL Retrieval Query Block

SELECT<attribute list>FROM[ WHERE<condition> ][ ORDER BY <attribute list> ];

# INSERT, DELETE, and UPDATE Statements in SQL

- Three commands used to modify the database:
  - INSERT, DELETE, and UPDATE
- **INSERT** typically inserts a tuple (row) in a relation (table)
- UPDATE may update a number of tuples (rows) in a relation (table) that satisfy the condition
- DELETE may also update a number of tuples (rows) in a relation (table) that satisfy the condition

#### INSERT

- In its simplest form, it is used to add one or more tuples to a relation
- Attribute values should be listed in the same order as the attributes were specified in the **CREATE TABLE** command
- Constraints on data types are observed automatically
- Any integrity constraints as a part of the DDL specification are enforced

#### The INSERT Command

• Specify the relation name and a list of values for the tuple. All values including nulls are supplied.

U1: INSERT INTO VALUES ('Richard', 'K', 'Marini', '653298653', '1962-12-30', '98 Oak Forest, Katy, TX', 'M', 37000, '653298653', 4 );

• The variation below inserts multiple tuples where a new table is loaded values from the result of a query.

U3B:	INSERT INTO	WORKS_ON_INFO ( Emp_name, Proj_name,
		Hours_per_week)
	SELECT	E.Lname, P.Pname, W.Hours
	FROM	PROJECT P, WORKS_ON W, EMPLOYEE E
	WHERE	P.Pnumber=W.Pno AND W.Essn=E.Ssn;

#### BULK LOADING OF TABLES

- Another variation of INSERT is used for bulk-loading of several tuples into tables
- A new table TNEW can be created with the same attributes as T and using LIKE and DATA in the syntax, it can be loaded with entire data.
- EXAMPLE:

CREATE TABLE D5EMPS LIKE EMPLOYEE (SELECT E.\* FROM EMPLOYEE AS E WHERE E.Dno=5) WITH DATA;

#### DELETE

- Removes tuples from a relation
  - Includes a WHERE-clause to select the tuples to be deleted
  - Referential integrity should be enforced
  - Tuples are deleted from only *one table* at a time (unless CASCADE is specified on a referential integrity constraint)
  - A missing WHERE-clause specifies that *all tuples* in the relation are to be deleted; the table then becomes an empty table
  - The number of tuples deleted depends on the number of tuples in the relation that satisfy the WHERE-clause

#### The DELETE Command

- Removes tuples from a relation
  - Includes a WHERE clause to select the tuples to be deleted. The number of tuples deleted will vary.

U4A:	DELETE FROM WHERE	EMPLOYEE Lname='Brown';
U4B:	DELETE FROM WHERE	EMPLOYEE Ssn='123456789';
U4C:	DELETE FROM WHERE	EMPLOYEE Dno=5;
U4D:	DELETE FROM	EMPLOYEE;

#### UPDATE

- Used to modify attribute values of one or more selected tuples
- A WHERE-clause selects the tuples to be modified
- An additional SET-clause specifies the attributes to be modified and their new values
- Each command modifies tuples *in the same relation*
- Referential integrity specified as part of DDL specification is enforced

#### UPDATE (contd.)

• Example: Change the location and controlling department number of project number 10 to 'Bellaire' and 5, respectively

U5:UPDATE PROJECT SET PLOCATION = 'Bellaire', DNUM = 5 WHERE PNUMBER=10

#### UPDATE (contd.)

- Example: Give all employees in the 'Research' department a 10% raise in salary.
   U6: UPDATE EMPLOYEE SET SALARY = SALARY \*1.1 WHERE DNO IN (SELECT DNUMBER FROM DEPARTMENT WHERE DNAME='Research')
- In this request, the modified SALARY value depends on the original SALARY value in each tuple
  - The reference to the SALARY attribute on the right of = refers to the old SALARY value before modification
  - The reference to the SALARY attribute on the left of = refers to the new SALARY value after modification

#### Additional Features of SQL

- Techniques for specifying complex retrieval queries (see Ch.7)
- Writing programs in various programming languages that include SQL statements: Embedded and dynamic SQL, SQL/CLI (Call Level Interface) and its predecessor ODBC, SQL/PSM (Persistent Stored Module) (See Ch.10)
- Set of commands for specifying physical database design parameters, file structures for relations, and access paths, e.g., CREATE INDEX

#### Additional Features of SQL (cont'd.)

- Transaction control commands (Ch.20)
- Specifying the granting and revoking of privileges to users (Ch.30)
- Constructs for creating triggers (Ch.26)
- Enhanced relational systems known as object-relational define relations as classes. Abstract data types (called User Defined Types-UDTs) are supported with CREATE TYPE
- New technologies such as XML (Ch.13) and OLAP (Ch.29) are added to versions of SQL

#### Summary

- SQL
  - A Comprehensive language for relational database management
  - Data definition, queries, updates, constraint specification, and view definition
- Covered :
  - Data definition commands for creating tables
  - Commands for constraint specification
  - Simple retrieval queries
  - Database update commands
